

# TrustLayer Posture Management

Ensure compliance with regulatory standards and mitigate the risk of misconfiguration, protecting your sensitive data from unauthorised access. CSPM and SSPM controls help identify and remediate risks in cloud infrastructure and cloud-based SaaS Applications.

The ever increasing complexity and complex, interconnected nature of cloud environments make them particularly vulnerable to security misconfigurations, emphasising the need for robust control. Improperly configured SaaS and IaaS policies are significant contributors to data breaches: in 2023 63% of organisations experienced a security incident due to a misconfiguration and today the primary cause of cloud data loss for 55% of businesses is due to human error.

Based on the Cloud Application Control technology within the TrustLayer Integrated Security Platform customers now have the ability to connect their Cloud Infrastructure and SaaS Applications via API and continuously monitor their configurations for potential errors and settings that may put them at risk of data breach.

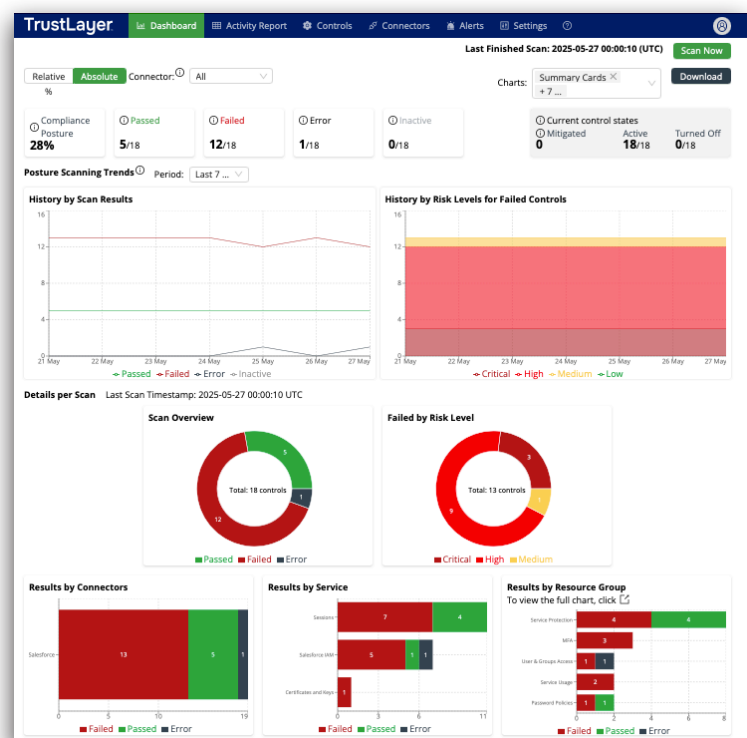

By combining Cloud Security Posture Management (CSPM) and SaaS Security Posture Management (SSPM) in a single module it allows you to focus on identifying and mitigating risk across all your cloud services. This ensures compliance with industry standards by automating the detection of misconfigurations to prevent unauthorised access.

By integrating CSPM and SSPM with TrustLayer's powerful CASB technology organisations can achieve a unified security posture - protecting the applications they rely on, ensuring robust user security, and increasing operational efficiency across the entire digital ecosystem.

## ENSURE COMPLIANCE WITH TRUSTLAYER POSTURE MANAGEMENT

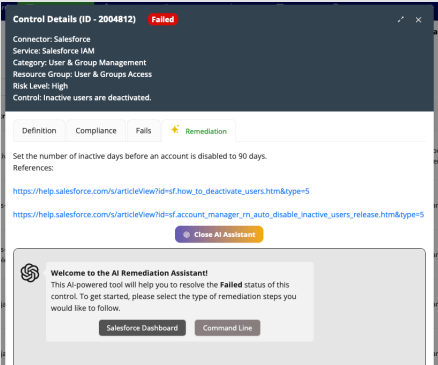

### CSPM & SSPM

- Automated security assessments and misconfiguration detection of cloud infrastructure.
- API-based connectors to major IaaS platforms such as AWS, Azure and GCP.
- Instant visibility of non-compliant settings and Indicators of Risk direct you to the critical items to address, no guesswork
- Direct links to remediation - guides you towards WHERE and HOW to implement corrective action
- Assistance with audit preparation and documentation for compliance against major governance frameworks such as ISO27001, NIS2, CE+
- Identify and Prioritise risk based on potential impact.
- Identify and mitigate excessive spread of unnecessary permissions
- Extends TrustLayer's award-winning CASB technology via API's to give visibility and control of security configuration across SaaS apps such as Salesforce and M365.

# DATASHEET: TrustLayer Posture Management

We understand that managing multiple vendor's product configurations can be overwhelming which is why every risk identified can be inspected. We explain what the control is, why it's failed, and more importantly what to do to remediate it quickly and effectively.
