

Your users are already using apps IT hasn't approved.

Shadow IT isn't a future risk – it's happening right now across your organisation. Unmanaged cloud apps, personal AI tools, unsanctioned file-sharing and unreviewed SaaS all create blind spots your security team can't govern.

The risks of Shadow IT:

- **Unapproved AI tools:** Sensitive data entering ChatGPT, Copilot alternatives or other AI engines outside approved controls
- **Unknown cloud apps:** Business data sitting in SaaS or cloud apps IT has not reviewed or risk-assessed
- **Risky file activity:** Uploads, downloads and shares creating data exposure across unmanaged platforms
- **Connected workflows:** AI and cloud apps joined together, moving data through services your team cannot see
- **Weak user oversight:** Security teams unable to govern activity – or even know it is happening

67%

of workers have used personal tools to increase productivity

80%

of workers admit to using apps without getting approval

44

the average number of high risk cloud services in operation

8%

of organisations have full visibility into their Shadow IT footprint.

Free Shadow IT & Cloud Risk Health Check

A two-week assessment that gives you a clear picture of what is happening across your estate – no long deployment, no disruption. What you get:

Visibility into which cloud and AI applications are in use across your environment

Identification of risky user behaviours – uploads, downloads, data sharing

A view of where sensitive data may be moving outside approved controls

Prioritised next steps: which apps and behaviours need attention first

A sample summary report you can share with your board or leadership team
